

Airplane Restraints...

These can be squared or bent round at the bottom...

I have made these out of galvanized pipe, rigid conduit, and square tubing
Dimensions are figured to the height and width of the horizontal stabilizers of
the planes you are going to restrain..... I have made 6 of these, and not one cost
more than \$5.00 to make so far, material wise..... I have welded and also braised
these together...

For my 30% Aircraft
1/2" rigid conduit or 1/2" pipe
3/8" solid rod
I used big nuts that the 3/8" rod would fit decently inside of for the pivot points
